

PEATLAND CAMPUS

Restoring Resilience in the Shannon Callows

Paula Ewald, Simge Pehlivan, Lukas Schiffner, Lena Werle
 Archipelagos: Towards A Cosmopolitical Architecture
 Raumgestaltung und Entwerfen

The project rethinks the type of the campus as three spatial interventions along the River Shannon in the Callows area, proposing a framework that redefines Ireland's relationship with water — from extraction to regeneration. It explores how peatland restoration and monastic archetypes can hybridise to create spaces of care.

At the *Extraction Void*, a concrete volume mirroring the pipeline's ten-minute water extraction makes water commodification visible while recalling the typology of Irish holy wells. At *Redwood Bog*, modular and temporary stations for research and restoration reference early Irish dwellings. The *Peatland Cloister Campus* unites these ideas into a framework for collective learning and ecological care.

The project proposes a forward-looking model for inhabiting restoration and resilience. It challenges extractive paradigms, not through opposition, but through architectural propositions that reframe learning as a ritual of stewardship.
